

1 **ABSTRACT OF THE DISCLOSURE**

2 A tool case has a body, at least one baffle and a positioning device. The
3 body has a recess with a bottom and multiple cavities defined in the bottom of
4 the recess to hold tools. The at least one baffle is pivotally attached to the body
5 with a pivot pin, is selectively received in the recess and covers the cavities in the
6 body. The positioning device is mounted in the inner surface of the cavity to hold
7 the at least one baffle closed relative to the body. Accordingly, the tools can be
8 held in the cavities by the at least one baffle, and forming a positioning device in
9 each cavity is unnecessary. Consequently, removing the tools from the cavities is
10 easy and convenient.
